

# vSync Transaction Network

## VTN Features

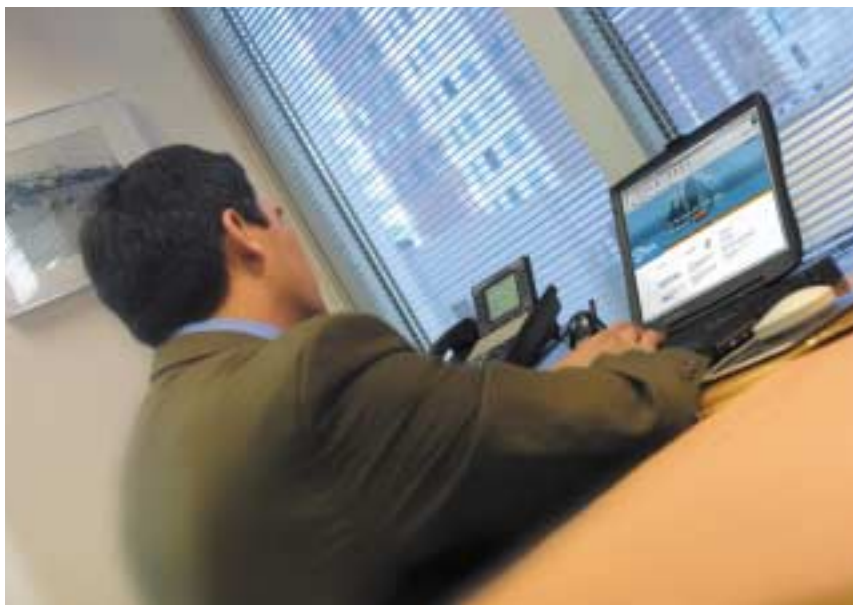

- **Cost-effective** - Significantly less than Traditional VANs, potentially free for "Hub & Spoke" participants.
- **Multiple secure connectivity options** - EDI-INT, Async, Bisync, Secure FTP, direct connection, as well as web-based data upload and download.
- **View data and readable/printable reports of electronic documents** - Ideal for trouble shooting and reference.
- **Extensive document search capabilities** - search by relevant data (PO Number, Invoice Number, etc.), date ranges, control numbers, partner information, etc.
- **Extensive document life cycle tracking** - From the moment documents are sent until they are received by trading partners.
- **"Any-to-Any" network level data translation** - EDI, XML, and proprietary data translation.
- **VAN Interconnectivity** - Supports connectivity to all major Value Added Networks.
- vSync supports AS2 natively within the network without requiring the purchase of software.

vSync Transaction Network (VTN) is an Electronic Business Transaction Network (EBTN) that uses the Internet to reduce the cost of doing Business-to-Business Electronic Commerce as well as adding features that are currently not available on other systems.

The Internet has proven to be the ideal way to transact business electronically, both securely and economically. By leveraging all that the Internet and web have to offer, VTN reduces the cost and increases the value of having a third-party provider of data communications, document tracking, document storage and retrieval, trading partner roll-outs, testing, and integration assistance.

VTN supports traditional Electronic Data Interchange (EDI) as well as XML and proprietary electronic documents. Using our network level translation feature allows companies to communicate with all of their business partners — fast, efficient, and cost-effectively.

Solutions you can count on.
